

ABSTRACT

The invention provides methods and systems that manage the provision of care by driving care providers to follow the wraparound process in the provision of care. The methods and systems include input of data into a database and subsequent use of the input data to fill data fields that the care providers utilizes in development of documents related to the provision of care. An authorization feature ensures that the input data is appropriate and a lock-out feature prohibits input of data for subsequent tasks until previous tasks are considered complete. The invention also includes report generation and financial tracking of the care providing process. The invention is expandable to incorporate all functions an organization may perform in the provision of care.
